University of Amsterdam, The Netherlands*

# Conflicts of interest

- Edwin van der Pol and Frank Coumans are cofounder and stakeholder of **EXOMETRY**

# Single extracellular vesicle (EV) analysis

- motivation
- requirements
- detection methods
  - nanoparticle tracking analysis (NTA)
  - tunable resistive pulse sensing (TRPS)
  - flow cytometry
- scatter-based standardization of flow cytometry measurements
- summary

# How do we study EV?

# Motivation to detect single EV

- EV are heterogeneous
- study the contribution of all EV, including rare EV

# Summit of EV characterization

- know the origin and function of *each* EV

# Requirements for single EV detection

“know the origin and function of *each* EV”

- count rate

- blood tube volume = 3 mL
- EV concentration\* =  $4 \cdot 10^7 \text{ mL}^{-1}$
- number of EV =  $10^8$
- measurement time = minutes
- count rate =  $10^5 \text{ s}^{-1}$

# Requirements for single EV detection

“know the origin and function of *each* EV”

- count rate =  $10^5 \text{ s}^{-1}$
- sensitivity = 30 nm EV

# Requirements for single EV detection

“know the origin and function of *each* EV”

- count rate =  $10^5 \text{ s}^{-1}$
- sensitivity = 30 nm EV
- identify EV

image: L. Rikkert

Vesicle Observation Center, Academic Medical Center, Amsterdam

# Requirements for single EV detection

“know the origin and function of *each* EV”

- count rate =  $10^5 \text{ s}^{-1}$
- sensitivity = 30 nm EV
- identify EV
- known detection volume

# Single extracellular vesicle (EV) analysis

- ✔ motivation
- ✔ requirements
- detection methods
  - nanoparticle tracking analysis (NTA)
  - tunable resistive pulse sensing (TRPS)
  - flow cytometry
- scatter-based standardization of flow cytometry measurements
- summary

# Nanoparticle tracking analysis

diameter from  
Brownian motion

- maximum count rate:  $\sim 10$  EV/s
- sensitivity: 70-90 nm EV
- identification: 1 fluorescence channel
- detection volume “known”: 1 order of magnitude error

# Reference sample of polystyrene beads

- summary

# Motivation of flow cytometry standardization

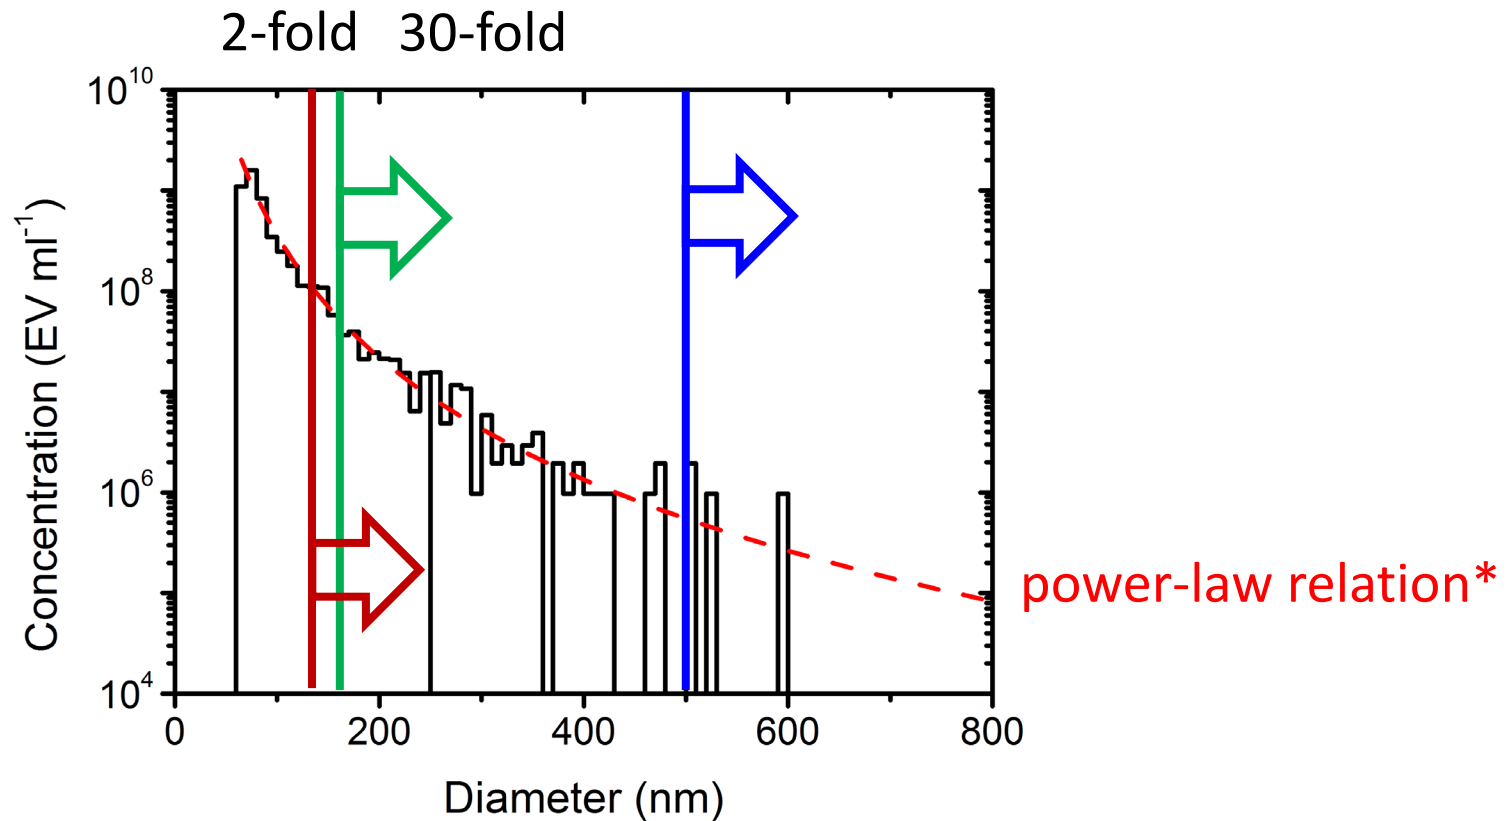

“Gasecka’s law”

- compare clinical EV data
- reported concentrations of plasma EV differ  $>10^6$ -fold

# Problem 1: instruments differ in sensitivity

\*van der Pol et al. *JTH* (2014)

# Problem 2: arbitrary units

same population of erythrocyte EV

Apogee A50-micro

Becton Dickinson FACSCanto II

# Goal

- obtain reproducible measurements of the EV concentration using different flow cytometers

# Study comprises 33 sites (64 instruments) worldwide

# Approach scatter-based standardization

- measure EV reference sample and controls
- determine flow rate
- scatter (a.u.) → diameter (nm)
  - measure METVES-beads
  - Exometry software obtains scatter to diameter relation
  - Exometry software provides EV size gates
- apply EV size gate to software (e.g. FlowJo) and report concentrations

# EV reference sample

- erythrocyte EV from blood bank concentrate
  - CD235a-FITC labeled
  - trigger on most sensitive scatter channel
  - exclude EV similar to isotype

# Approach scatter-based standardization

- ✔ measure EV reference sample and controls
- determine flow rate
- scatter (a.u.) → diameter (nm)
  - measure METVES-beads
  - Exometry software obtains scatter to diameter relation
  - Exometry software provides EV size gates
- apply EV size gate to software (e.g. FlowJo) and report concentrations

# Determine flow rate

$$\text{concentration} = \frac{\# \text{ of EV}}{\text{flow rate} \times \text{measurement time}}$$

# Approach scatter-based standardization

- ✔ measure EV reference sample and controls
- ✔ determine flow rate
- scatter (a.u.) → diameter (nm)
  - measure METVES-beads
  - Exometry software obtains scatter to diameter relation
  - Exometry software provides EV size gates
- apply EV size gate to software (e.g. FlowJo) and report concentrations

# Exclusion of flow cytometers (FCM)

# Sensitivity of 46 flow cytometers in the field

✘ = unable to detect 400 nm polystyrene beads

# 400 nm polystyrene beads scatter more than 1,000 nm EV

# Sensitivity of 46 flow cytometers in the field

✗ = unable to detect EV < 1000 nm

# Approach scatter-based standardization

- ✔ measure EV reference sample and controls
- ✔ determine flow rate
- ✔ scatter (a.u.) → diameter (nm)
  - ✔ measure METVES-beads
  - ✔ Exometry software obtains scatter to diameter relation
  - ✔ Exometry software provides EV size gates
- apply EV size gate to software (e.g. FlowJo) and report concentrations

# Reproducibility of 1200-3000 nm EV

# Reproducibility of 1200-3000 nm EV

| %CV                                       | All | SSC only | FSC only |
|---|-----|----------|----------|
| Gate on beads                             | 74% | 60%      | 80%      |
| Gate on EV size with light scatter theory | 59% | 42%      | 92%      |

%CV = standard deviation / mean \* 100%  
Preliminary results

# Reproducibility of 600-1200 nm EV

# Reproducibility of 300-600 nm EV

# Conclusions scatter-based standardization

- flow rate calibration is essential
- many flow cytometers used in EV research do not detect EV by scatter-based triggering
- EV size gate by Mie theory (CV=59%) leads to better reproducibility than gate on beads (CV=74%)

# Discussion scatter-based standardization

- assumption of EV size gate by Mie theory
  - EV have similar refractive index of 1.4
- discrepancy between FSC and SSC
  - due to incorrectly selected refractive index?
- standardization of EV sizes <1200 nm ineffective

# Single extracellular vesicle (EV) analysis

- ✔ motivation
- ✔ requirements
- ✔ detection methods
  - ✔ nanoparticle tracking analysis (NTA)
  - ✔ tunable resistive pulse sensing (TRPS)
  - ✔ flow cytometry
- ✔ scatter-based standardization of flow cytometry measurements
- summary

# Summary

- heterogeneity of EV requires single EV analysis
- sensitive flow-based techniques are superior to NTA and TRPS
- scatter-based standardization of flow cytometry measurements
  - provides insight (EV diameter)
  - improves reproducibility (CV=59%)
  - is compatible with fluorescence approaches for next standardization initiatives

# Outlook

| Hematology parameter       | Concentration (vesicles mL <sup>-1</sup> ) |
|----------------------------|--|
| Platelet vesicle count     | 2.3 – 6.2 · 10 <sup>9</sup>                |
| Erythrocyte vesicle count  | 7.0 – 8.6 · 10 <sup>10</sup>               |
| Reticulocyte vesicle count | 3.9 – 15.6 · 10 <sup>8</sup>               |
| Leukocyte vesicle count    | 6.2 – 16.4 · 10 <sup>7</sup>               |
| Total vesicle count        | 7.3 – 9.4 · 10 <sup>10</sup>               |
