WHENEVER SOMEONE UPLOADS A LETTERBOXED
16:9 VIDEO RESCALED TO 4:3, I DO THIS TO THEIR CAR.

Extracellular vesicles

Why measure vesicle concentrations?

- Blood plasma contains heterogeneous vesicle populations with clinical information*

Hematology parameter	Concentration (vesicles mL ⁻¹)
Platelet vesicle count	2.3 – 6.2 · 10 ⁹
Erythrocyte vesicle count	7.0 – 8.6 · 10 ¹⁰
Reticulocyte vesicle count	3.9 – 15.6 · 10 ⁸
Leukocyte vesicle count	6.2 – 16.4 · 10 ⁷
Total vesicle count	7.3 – 9.4 · 10 ¹⁰

Problem definition

- Number concentration (vesicles / mL):
number of vesicles per sample volume
- Practical requirements:
detect and characterize all vesicles
in a known sample volume
at a clinically relevant rate

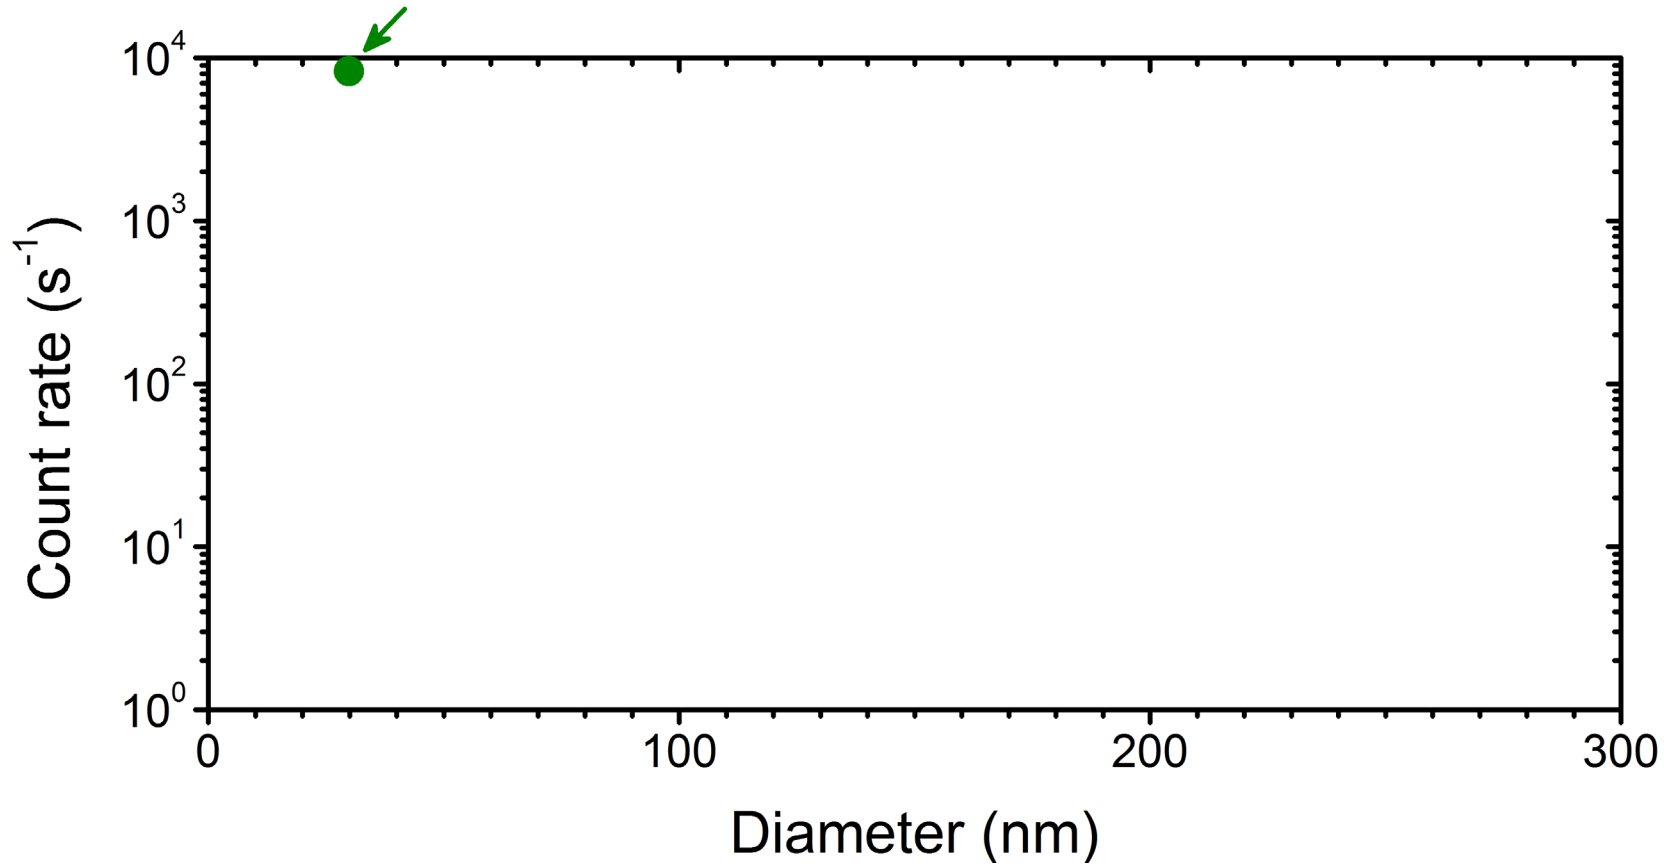

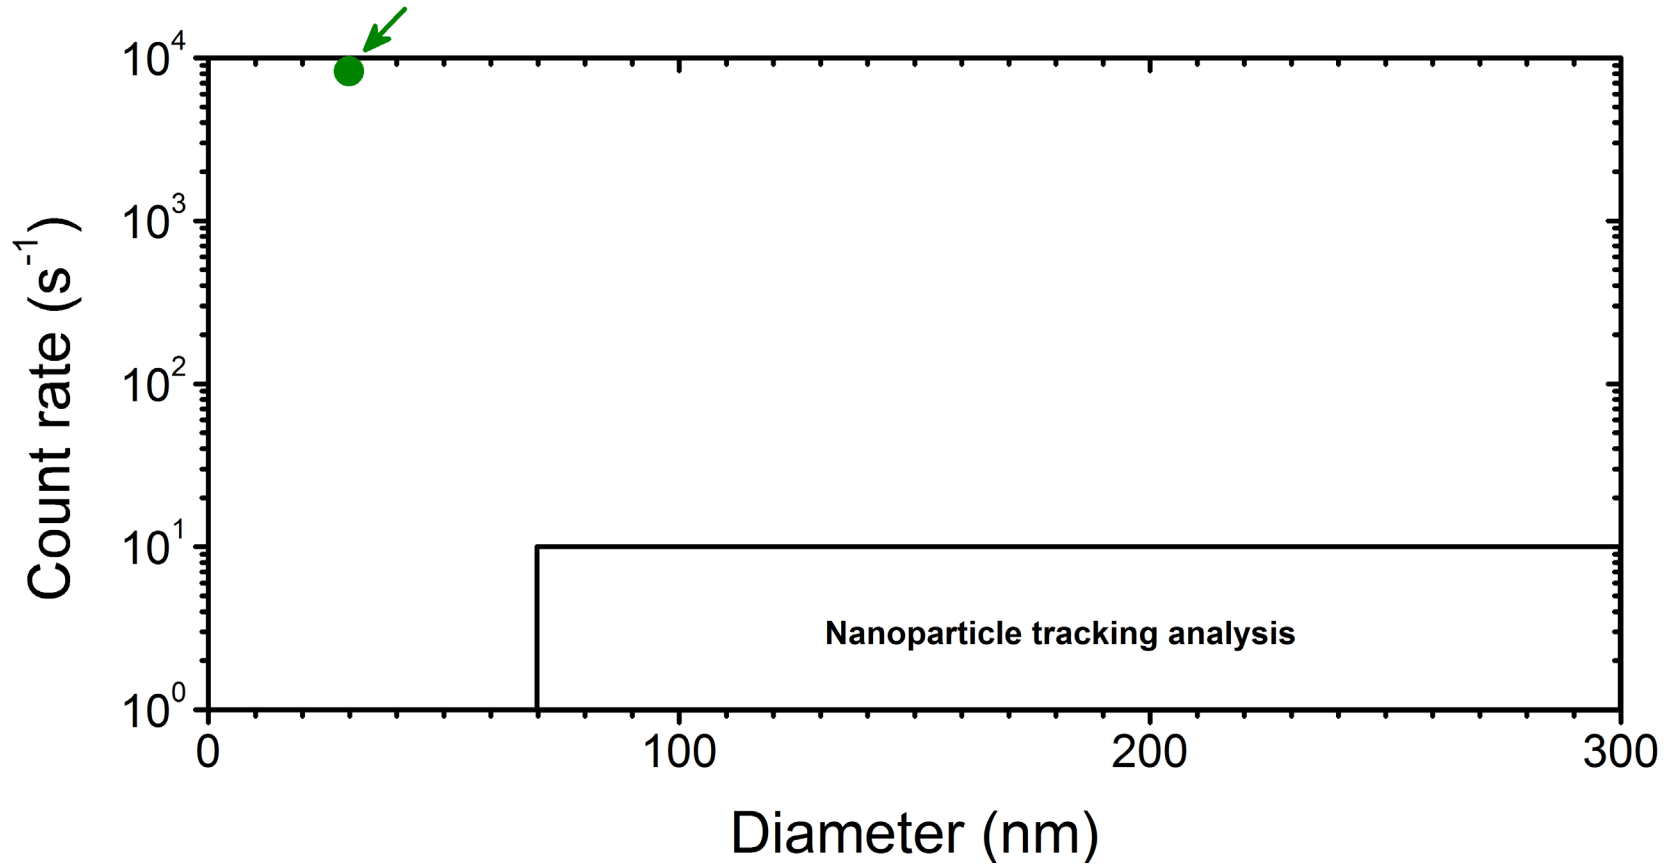

Outline measuring vesicle concentrations

- Speed versus size
- Sample volume determination
- Detection limits
- Standardize the unknown

The text "TRAVEL THE UNKNOWN" is displayed in a bold, black, hand-painted style. The letters are thick and have irregular, textured edges, giving it a rugged and adventurous appearance. The words are stacked vertically: "TRAVEL" on the top line, "THE" in the middle, and "UNKNOWN" on the bottom line. The overall aesthetic is reminiscent of a travel poster or a logo for an outdoor brand.

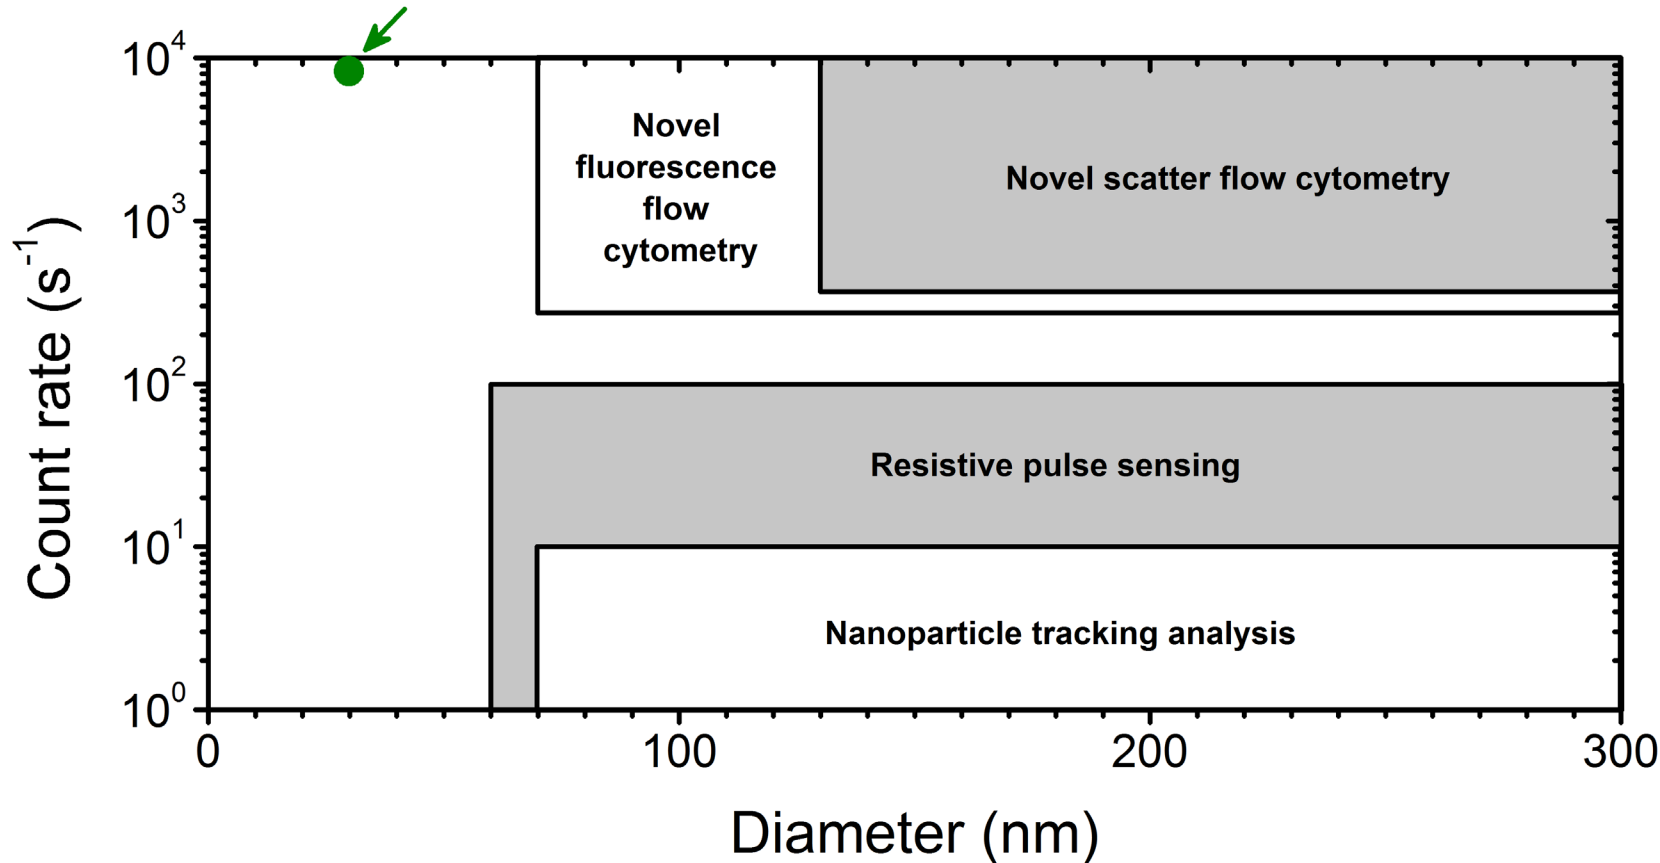

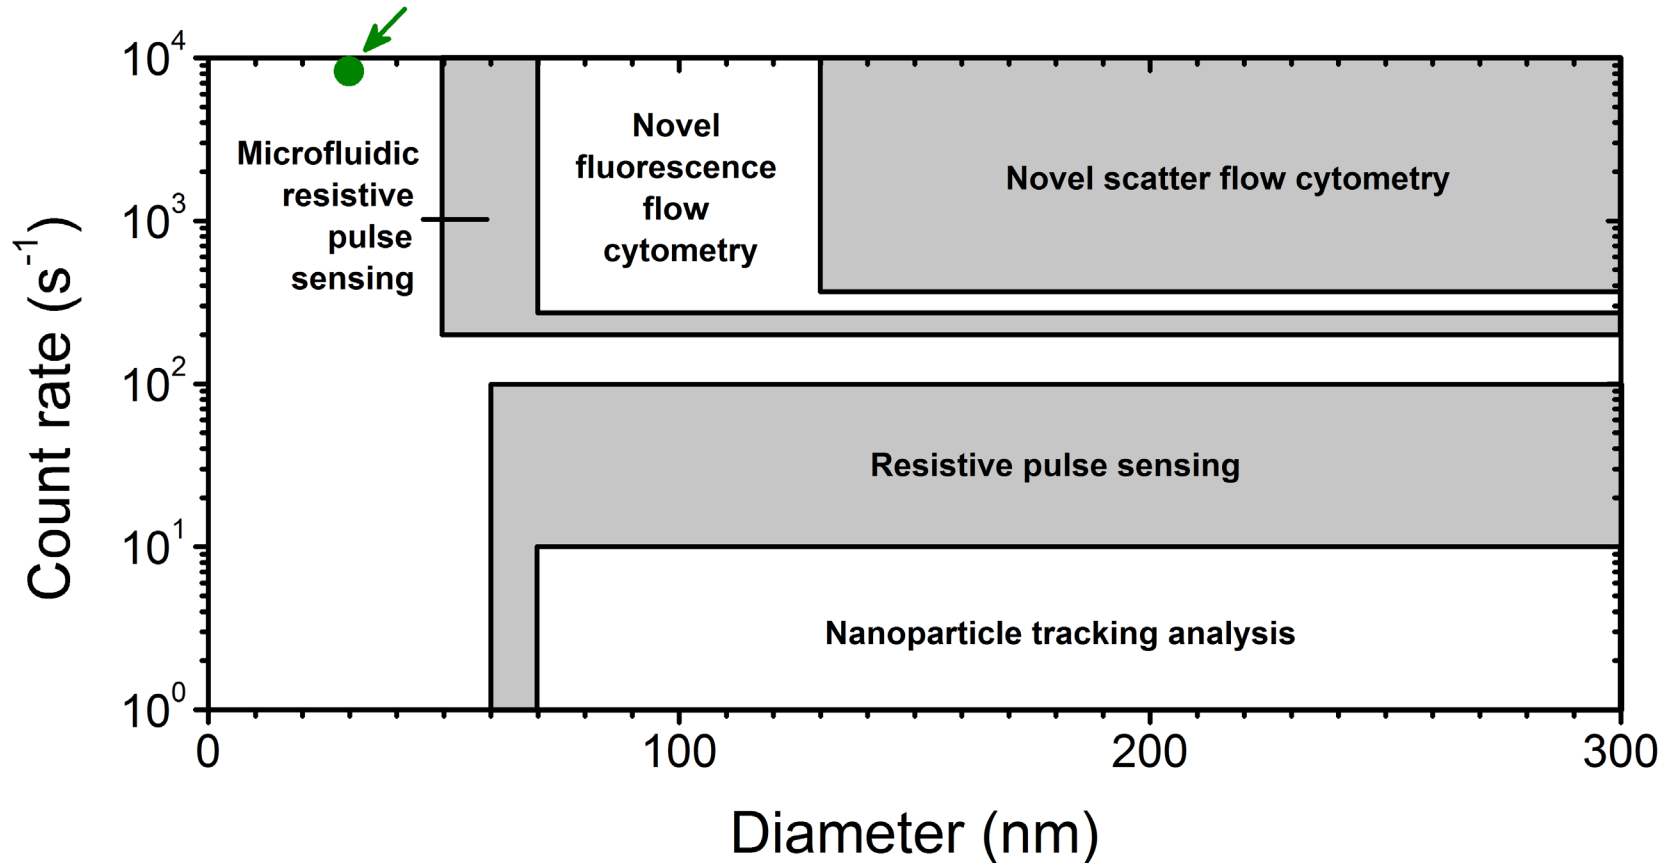

Outline measuring vesicle concentrations

- ✔ Speed versus size
- Sample volume determination
- Detection limits
- Standardize the unknown

The text "TRAVEL THE UNKNOWN" is displayed in a bold, black, hand-painted style. The word "TRAVEL" is on the top line, "THE" is centered on the second line, and "UNKNOWN" is on the bottom line. The letters have a rough, textured appearance with some white highlights and shadows, giving it a graffiti-like or stencil-like feel.

Sample volume determination

concentration [μL^{-1}] = particles / sample volume [μL]

sample volume [μL] = flow rate [$\mu\text{L}/\text{min}$] · time [min]

- Flow rate
 - Specified
 - Calibrated
- Fixed volume

Calibrated versus specified flow rate

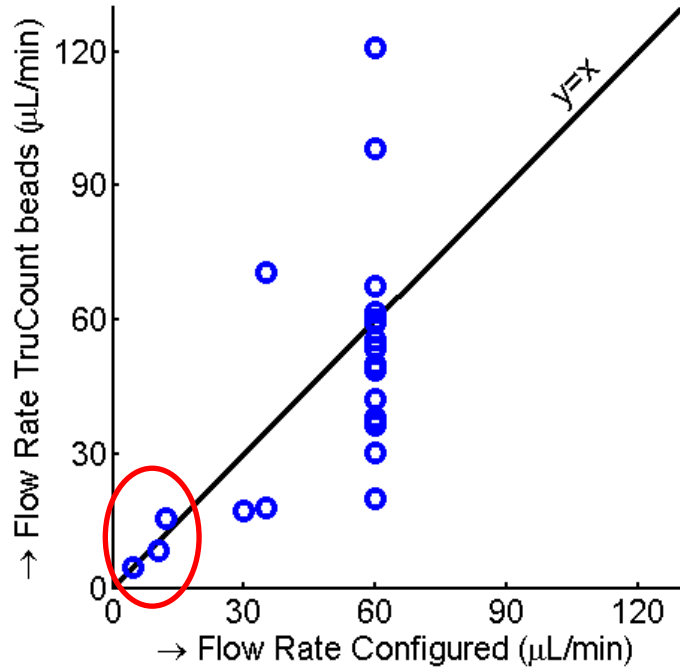

Most flow cytometers:

Differential pressure

Calibrated versus specified flow rate

Apogee A60-Micro:

Actuated syringe pump

Calibrated flow rate versus syringe pump

- Disadvantage syringe pump
 - Particles stick to tubing (>0.4%)
- Disadvantage calibration particles
 - Trucount beads
 - Error unknown
 - Too big (>3 μm) thus too bright
 - No sub- μm concentration reference particles

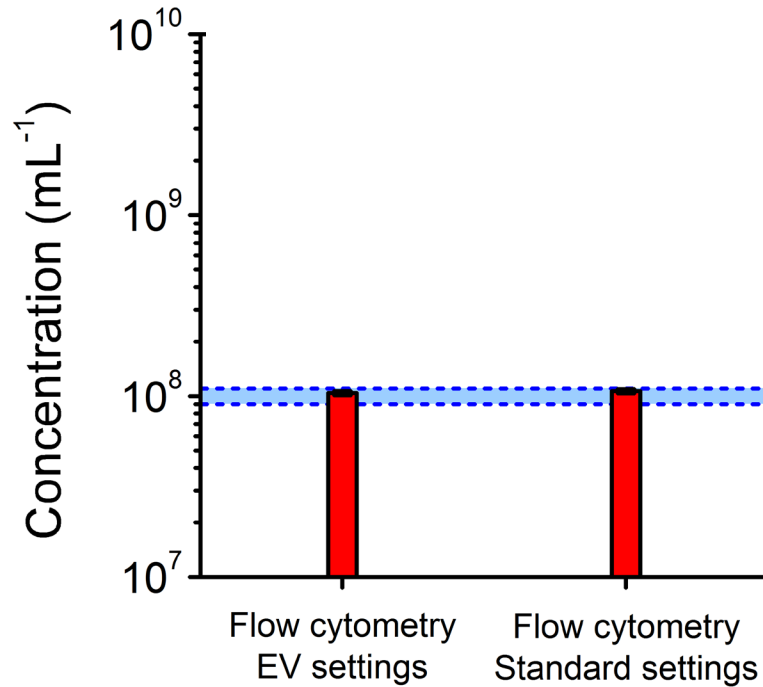

Sample volume determination

concentration [μL^{-1}] = particles / sample volume [μL]

sample volume [μL] = flow rate [$\mu\text{L}/\text{min}$] · time [min]

- ✓ Flow rate
 - ✓ Specified
 - ✓ Calibrated
- Fixed volume: nanoparticle tracking analysis (NTA), used by 58% of the research field*

Syringe flow rate versus fixed volume

Syringe flow rate versus fixed volume

Outline measuring vesicle concentrations

- ✓ Speed versus size
- ✓ Sample volume determination
- Detection limits
- Standardize the unknown

The text "TRAVEL THE UNKNOWN" is displayed in a bold, black, hand-painted style. The letters are thick and have irregular, textured edges, giving it a rugged and adventurous appearance. The words are stacked vertically: "TRAVEL" on the top line, "THE" in the middle, and "UNKNOWN" on the bottom line. The background behind the text is a light, slightly textured grey.

Detection limits and “the unknown”

Unknown

Detection limit itself is unknown and differs per detector!

Standardize “the unknown”

1. Calibrate flow rate ($\mu\text{L}/\text{min}$) **IStH**

2. Calibrate scatter (nm^2) **IStH**

3. Calibrate fluorescence (MESF)

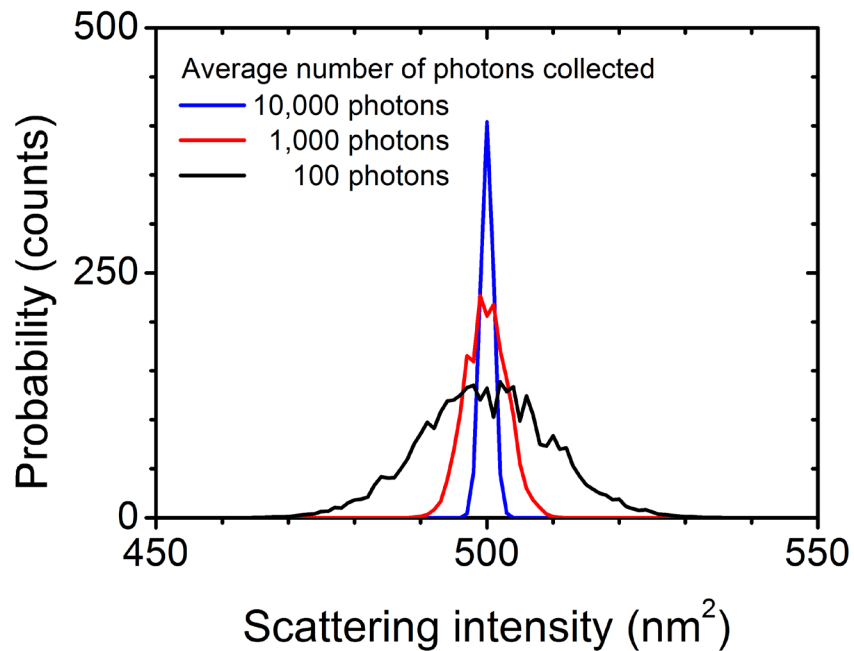

Data with comparable units

- Run beads of known
 - concentration (mL^{-1})
 - mean equivalent fluorescence intensity (MESF)
 - scattering intensity (nm^2) for the collection angles of the instrument

Detection limits with comparable units

Summary

- Vesicle concentrations are future clinical parameters
- NTA does not measure concentration (error >100%)
- To measure vesicle concentrations, calibrate
 - flow rate ($\mu\text{L}/\text{min}$)
 - fluorescence intensity (MESF)
 - scatter intensity (nm^2)and determine and report detection limits
